7. Turing Machines
7.1. A General Model of Computation
7.2. Turing Machines as Language Acceptors
7.3. Turing Machines That Compute Partial Functions

Part of an exercise from exercise class 1

## Exercise 7.4.

For each of the following languages, draw a transition diagram for a Turing machine that accepts that language.
a. ...
b. $\left\{a^{i} b^{j} \mid i<j\right\}$
C. . . .
d. . . .

Example 7.7. Accepting $L=\left\{a^{i} b a^{j} \mid 0 \leq i<j\right\}$

Example 7.7. Accepting $L=\left\{a^{i} b a^{j} \mid 0 \leq i<j\right\}$
What if $x \notin L$ ?

Example 7.7. Accepting $L=\left\{a^{i} b a^{j} \mid 0 \leq i<j\right\}$

To illustrate that a Turing machine $T$ may run forever for an input that is not in $L(T)$. No problem!

No problem?

Definition 2.11. A Finite Automaton

A finite automaton (FA) is a 5-tuple ( $Q, \Sigma, q_{0}, A, \delta$ ), where $\ldots$

Definition 5.1. A Pushdown Automaton

A pushdown automaton (PDA)
is a 7 -tuple $M=\left(Q, \Sigma,\left\ulcorner, q_{0}, Z_{0}, A, \delta\right)\right.$, where $\ldots$

Definition 7.1. Turing machines
A Turing machine (TM) is ...

Part of a slide from lecture 1

## Turing machine

Turing machine has a finite alphabet of symbols. (actually two alphabets...)
Turing machine has a finite number of states.

### 7.1. A General Model of Computation

Definition 7.1. Turing machines
A Turing machine (TM) is a 5-tuple $T=\left(Q, \Sigma, \Gamma, q_{0}, \delta\right)$, where
$Q$ is a finite set of states. The two halt states $h_{a}$ and $h_{r}$ are not elements of $Q$.
$\Sigma$, the input alphabet, and $\Gamma$, the tape alphabet, are both finite sets, with $\Sigma \subseteq \Gamma$. The blank symbol $\Delta$ is not an element of $\Gamma$.
$q_{0}$, the initial state, is an element of $Q$.
$\delta$ is the transition function: ...

Part of a slide from lecture 1

Assumptions about a human computer working with a pencil and paper:

1. ...
2. Each step taken by the computer depends only on the symbol he is currently examining and on his "state of mind" at the time;
3. ...

A slide from lecture 1

A move of a Turing machine consists of:

1. Changing from the current state to another, possibly different state;
2. Replacing the symbol in the current square by another, possibly different symbol;
3. Leaving the tape head on the current square, or moving it one square to the right, or moving it one square to the left if it is not already on the leftmost square.

$$
\delta(p, X)=(q, Y, D)
$$

$$
\begin{gathered}
f(n)=n! \\
f(x, y)=x * y
\end{gathered}
$$

Definition 7.1. Turing machines
A Turing machine (TM) is a 5-tuple $T=\left(Q, \Sigma,\left\ulcorner, q_{0}, \delta\right)\right.$, where
$Q$ is a finite set of states. The two halt states $h_{a}$ and $h_{r}$ are not elements of $Q$.
$\Sigma$, the input alphabet, and $\Gamma$, the tape alphabet, are both finite sets, with $\Sigma \subseteq \Gamma$. The blank symbol $\Delta$ is not an element of $\Gamma$.
$q_{0}$, the initial state, is an element of $Q$.
$\delta$ is the transition function:

$$
\delta: Q \times(\Gamma \cup\{\Delta\}) \rightarrow\left(Q \cup\left\{h_{a}, h_{r}\right\}\right) \times(\ulcorner\cup\{\Delta\}) \times\{R, L, S\}
$$

If $q$ is $h_{a}$ or $h_{r}$, the move causes $T$ to halt

What if $D=L$ and $T$ is on square 0 ?

Normally, TM starts with

- input string starting in square 1 and all other squares blank,
- and its tape head on square 0 .

Tape always contains finite number of nonblanks.

## Notation:

configuration. . .

## Notation:

description of tape contents: $x \underline{\sigma} y$ or $x \underline{y}$
$x \underline{y}=x \underline{y} \Delta=x \underline{y} \Delta \Delta$
if $y=\Lambda$, then $x \underline{\Delta}$

## Notation:

description of tape contents: $x \underline{\sigma} y$ or $x \underline{y}$
$x \underline{y}=x \underline{y} \Delta=x \underline{y} \Delta \Delta$
if $y=\Lambda$, then $x \underline{\Delta}$
configuration $x q y=x q y \Delta=x q y \Delta \Delta$
if $y=\Lambda$, then $x q \Delta$
$\left(Q \cup\left\{h_{a}, h_{r}\right\}\right) \cap(\Gamma \cup\{\Delta\})=\emptyset$

## Notation:

description of tape contents: $x \underline{\sigma} y$ or $x \underline{y}$
$x \underline{y}=x \underline{y} \Delta=x \underline{y} \Delta \Delta$
if $y=\Lambda$, then $x \underline{\Delta}$
configuration $x q y=x q y \Delta=x q y \Delta \Delta$
if $y=\Lambda$, then $x q \Delta$
move: $x q y \vdash_{T} z r w \quad x q y \vdash_{T}^{*} z r w$ $x q y \vdash z r w \quad x q y \vdash^{*} z r w$
example: configuration aabqa $\Delta a$ and $\delta(q, a)=(r, \Delta, L)$
initial configuration corresponding to input $x$ : ...

## Notation:

description of tape contents: $x \underline{\sigma} y$ or $x \underline{y}$
$x \underline{y}=x \underline{y} \Delta=x \underline{y} \Delta \Delta$
if $y=\bar{\wedge}$, then $x \triangle$
configuration $x q y=x q y \Delta=x q y \Delta \Delta$
if $y=\Lambda$, then $x q \Delta$
move: $x q y \vdash_{T} z r w \quad x q y \vdash_{T}^{*} z r w$ $x q y \vdash z r w \quad x q y \vdash^{*} z r w$
example: configuration aabqa $\Delta a$ and $\delta(q, a)=(r, \Delta, L)$
initial configuration corresponding to input $x$ : $q_{0} \Delta x$

## Properties of notation xqy

- all information about configuration in one string
- move TM yields only local change

Useful, when ...

### 7.2. Turing Machines <br> as Language Acceptors

Definition 7.2. Acceptance by a TM
If $T=\left(Q, \Sigma, \Gamma, q_{0}, \delta\right)$ is a TM and $x \in \Sigma^{*}$,
$x$ is accepted by $T$ if

$$
q_{0} \Delta x \vdash_{T}^{*} w h_{a} y
$$

for some strings $w, y \in(\Gamma \cup\{\Delta\})^{*}$
(i.e., if, starting in the initial configuration corresponding to input $x, T$ eventually halts in the accepting state).
N.B.: sequence of moves leading to $h_{a}$ is unique

A language $L \subseteq \Sigma^{*}$ is accepted by $T$ if $L=L(T)$, where

$$
L(T)=\left\{x \in \Sigma^{*} \mid x \text { is accepted by } T\right\}
$$

If $x \notin L(T), \ldots$

A slide from lecture 1

### 7.2. Turing Machines as Language Acceptors

Example 7.3. A TM Accepting a Regular Language
$L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}$
First a finite automaton:

Example 7.3. A TM Accepting a Regular Language

$$
L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}
$$

Example 7.3. A TM Accepting a Regular Language

$$
L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}
$$

## Example 7.3. A TM Accepting a Regular Language

Example 7.3. A TM Accepting a Regular Language

# 7.3. Turing Machines <br> That Compute Partial Functions 

$$
f(x, y)=x / y
$$

with real numbers
$f(x, y)$ is not defined if $y=0$

# 7.3. Turing Machines That Compute Partial Functions 

Example 7.10. The Reverse of a String

### 7.3. Turing Machines That Compute Partial Functions

Example 7.10. The Reverse of a String
$\triangle a a b a b$
$\triangle A a b a b$
$\triangle A a b a A$
$\triangle B a b a A$
$\triangle B A b a A$
$\triangle B A b A A$
$\triangle B A b A A$
$\triangle B A B A A$
$\triangle b a b a a$

Definition 7.1. Turing machines
A Turing machine (TM) is a 5-tuple $T=\left(Q, \Sigma,\left\ulcorner, q_{0}, \delta\right)\right.$, where
$Q$ is a finite set of states. The two halt states $h_{a}$ and $h_{r}$ are not elements of $Q$.
$\Sigma$, the input alphabet, and $\Gamma$, the tape alphabet, are both finite sets, with $\Sigma \subseteq \Gamma$. The blank symbol $\Delta$ is not an element of $\Gamma$.
$q_{0}$, the initial state, is an element of $Q$.
$\delta$ is the transition function:

$$
\delta: Q \times(\Gamma \cup\{\Delta\}) \rightarrow\left(Q \cup\left\{h_{a}, h_{r}\right\}\right) \times(\ulcorner\cup\{\Delta\}) \times\{R, L, S\}
$$

Simple version of:

Definition 7.9. A Turing Machine Computing a Function

Let $T=\left(Q, \Sigma, \Gamma, q_{0}, \delta\right)$ be a Turing machine, and $f$ a partial function on $\Sigma^{*}$ with values in $\Gamma^{*}$. We say that $T$ computes $f$ if for every $x$ in the domain of $f$,

$$
q_{0} \Delta x \vdash_{T}^{*} h_{a} \Delta f(x)
$$

and no other input string is accepted by $T$.

Definition 7.9. A Turing Machine Computing a Function

Let $T=\left(Q, \Sigma, \Gamma, q_{0}, \delta\right)$ be a Turing machine, $k$ a natural number, and $f$ a partial function on $\left(\Sigma^{*}\right)^{k}$ with values in $\Gamma^{*}$. We say that $T$ computes $f$ if for every $\left(x_{1}, x_{2}, \ldots, x_{k}\right)$ in the domain of $f$,

$$
q_{0} \Delta x_{1} \Delta x_{2} \Delta \ldots \Delta x_{k} \vdash_{T}^{*} h_{a} \Delta f\left(x_{1}, x_{2}, \ldots, x_{k}\right)
$$

and no other input that is a $k$-tuple of strings is accepted by $T$.
A partial function $f:\left(\Sigma^{*}\right)^{k} \rightarrow \Gamma^{*}$ is Turing-computable, or simply computable, if there is a TM that computes $f$.
$k$ can be 0...

Functions on natural numbers...

Example 7.12. The Quotient and Remainder Mod 2

## Example.

## Dividing by 3

## Example.

Accepting $\left\{x y x \quad \mid x, y \in\{a, b\}^{*}\right.$ and $\left.|x|=|y|\right\}$

## Exercise.

Draw a TM that computes the function $f(x, y)=x \bmod y$

Hint: implement the following algorithm:

```
while ( x >= y )
    \(x=x-y ;\)
```

Make this exercise yourself.

Example 7.3. A TM Accepting a Regular Language

$$
L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}
$$

Example 7.14. The Characteristic Function of a Set

$$
L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}
$$

$\chi_{L}:\{a, b\}^{*} \rightarrow\{0,1\}$, defined by

$$
\chi_{L}(x)= \begin{cases}1 & \text { if } x \in L \\ 0 & \text { if } x \notin L\end{cases}
$$

Example 7.3. A TM Accepting a Regular Language

$$
L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}
$$

Example 7.14. The Characteristic Function of a Set $L=\{a, b\}^{*}\{a b\}\{a, b\}^{*} \cup\{a, b\}^{*}\{b a\}$

$q_{0} \triangle a a b a \vdash \triangle a^{\prime}+\Delta b a \vdash \triangle a q a b a \vdash \triangle a a q b a \vdash \triangle a a b r a \vdash \triangle a a b a r \Delta \vdash$ $\triangle a a b u a \vdash \Delta a a u b \vdash \Delta a u a \vdash \Delta u a \vdash u \Delta \vdash \Delta v \Delta \vdash h_{a} \Delta 1$

Example 7.14. The Characteristic Function of a Set

$$
\chi_{L}(x)= \begin{cases}1 & \text { if } x \in L \\ 0 & \text { if } x \notin L\end{cases}
$$

From computing $\chi_{L}$ to accepting $L$

From accepting $L$ to computing $\chi_{L}$
